SUBMISSION OF DECLARATIONS AND SUBSTITUTE SPECIFICATION PAGES

Sir:

In response to a telephone communication from the Examiner, enclosed herewith is a new inventor declaration (executed by two of the three inventors) that in greater detail explains the error upon which the above-identified reissue is based. A declaration of Alan Loudermilk accompanies the inventor declaration, which explains the diligent, but unsuccessful, efforts, to locate the third co-inventor, Richard Thaik.

Applicant requests that the inventor declaration submitted herewith be accepted by the U.S. Patent Office, in view of the diligent efforts made to locate Mr. Thaik.

Also at the request of the Examiner, Applicant is submitting herewith substitute specification pages for columns 31 and 32. This resubmission was necessitated by the certificate of correction issued for the original patent; the newly submitted column 32 has been changed to reflect the change in the certificate of correction.

No new matter has been added by this submission. This application is submitted to be in condition for allowance and such is respectfully requested.

04/08/2003 AKELLEY 00000025 500251 09173582

01 FC:1460 130.00 CH

Applicant's attorney requests an opportunity to discuss this case with the Examiner by way of a telephone or in-person interview in order to address any additional questions, etc., that the Examiner may have.

Please charge any additional fees due, or credit any overpayment, to Deposit Account No. 50-0251.

Respectfully submitted,

Alan R. Loudermilk

DECLARATION OF ALAN R. LOUDERMILK

I, Alan R. Loudermilk, am the patent attorney prosecuting this reissue application on behalf of the Applicant.

In response to a telephone call from the Examiner, a new declaration explaining in greater detail the "at least one error upon which reissue is based" was prepared (as will be apparent from the original declaration and the newly-submitted declaration, the at least one error is Applicant claiming less than Applicant was entitled to claim, which is described in the new declaration in detail and is readily apparent from a comparison of the originally-issued claims with the claims added in this reissue). This new declaration was signed by two of the three co-inventors, Geetha N.K. Rangan and Debra J. Worsley. I have been unable to locate the third named inventor, Richard Thaik.

This declaration is provided to explain that I have made a diligent effort in attempting to locate Richard Thaik. He is no longer employed with the former assignee of the patent that is being reissued (National Semiconductor), and he is no longer employed by his last known

employer (Cisco Systems). It was at Cisco Systems in San Jose that I last met Mr. Thaik in May 1999, which was at the time of execution of the originally-submitted declaration. My recent efforts to location Mr. Thaik include the following.

I made numerous calls to Cisco System and was unable to determine any information regarding his current whereabouts. A letter sent to Cisco Systems was returned to sender. Responses were not received to the letters sent to his last two (believed) home addresses (1566 Cleo Springs Drive, San Jose CA 95131, and 4325 Renaissance Drive, San Jose, CA 95134). Calls to directory assistance were unsuccessful. Various Internet-based searches were not successful. I attempted to track Mr. Thaik down through Purdue University, from which he graduated and to which he has contributed over the years, but the contact information that he maintained with Purdue University had not been updated.

Based on the previously friendly and cooperative interaction that I had with Mr. Thaik in 1999, it would seem that he has moved to an unknown location and has not received, or is not in position to receive, the correspondence that has been sent to him. Accordingly, and in view of the foregoing, Applicant is submitting a new Declaration executed by the remaining co-inventors and requests that this new Declaration be accepted by the US Patent Office.

I declare that all statements made herein of my knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the reissue application or any patent issued thereon.

Respectfully submitted,

A handwritten signature in black ink, appearing to read 'A. Loudermilk', written in a cursive style.

REISSUE APPLICATION DECLARATION BY THE INVENTOR

Docket Number (Optional)

VN169RI

As a below named inventor, I hereby declare that:

My residence, mailing address and citizenship are stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is described and claimed in patent number 55166169, granted October 15, 1996, and for which a reissue patent is sought on the invention entitled Data Communication Network with Transfer Port, Cascade Port and/or Frame Synchronizing Signal the specification of which

☐ is attached hereto.

☒ was filed on October 15, 1998 as reissue application number 09/173,582 and was amended on 5/17/00.
(If applicable)

I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR 1.56.

I verily believe the original patent to be wholly or partly inoperative or invalid, for the reasons described below. (Check all boxes that apply.)

☐ by reason of a defective specification or drawing.☐ by reason of the patentee claiming more or less than he had the right to claim in the patent.☐ by reason of other errors.

At least one error upon which reissue is based is described below. If the reissue is a broadening reissue, such must be stated with an explanation as to the nature of the broadening:

by reason of claiming only the subject matter of claims 1-15, which is less than the full right to claim in the original application. Accordingly, new claims 16-141 were added. For example, comparing claim 16 to original claim 14, claim 14 was limited to a "receive memory device," a "transmit memory device," a "plurality of receive datapaths," and a "plurality of transmit datapaths." As the originally-filed specification makes clear, this was less than Applicant was entitled to claim, and therefore new claim 16, which parallels original claim 14, recites a "receive memory," a "transmit memory," "one or more receive datapaths," and "one or more transmit data paths." In addition, Applicant, in combination with independent claim 16, was entitled to claim the subject matter of dependent claims 17-57, but did not do so in the original application. Similar errors of claiming less than Applicant was entitled to claim can be seen from the subject matter of new claims 58-141, which include subject matter that Applicant was entitled to claim but did not in the original application.

TABLE X

Signal Name	Description	
RXD+RXD-	Twisted pair receive inputs	
TXOP+TXO-	Twisted pair transmit outputs	15
TXO+TXOP-		
TXD	Transmit Data Input. Serial NRZ data input from the controller.	
TXE	Transmit Enable	
TXC	Transmit Clock. A 10 Mhz clock derived from the 10 Mhz ECLK input.	30
COL	Collision Detect output. Generates an active high signal when the transceiver function of the physical layer portion detects a collision	
RXD	Receive Data Output	
RXC	Receive clock	
CRS	Carrier Sense	35
ECRS	Early carrier sense. In mixed configuration, this signal goes active when valid data has reached the input of the Ethernet receive FIFO	
LCLK	Link Clock. Used by the transmit circuit as the bit level clock for data encoding upon the isochronous/ethernet link.	40
ECLK	Ethernet clock. Used to encode data when the physical layer portion is operating in 10 Base T mode.	
IRFS	Isochronous Receive frame synch. This output marks the beginning of a receive frame cycle.	
IRXD	Isochronous receive data	45
IRXE	Isochronous receive enable	
IFR	Isochronous Frame reference	
ITFS	Isochronous transmit frame synch. Marks the beginning of a transmit frame cycle.	
ITXD	Isochronous Transmit data	50

What is claimed is:

1. In a data communication network for communicating data between a plurality of data stations over a communications medium under control of a processor which outputs a plurality of control signals, apparatus comprising:
 - a receive memory means and a transmit memory means;
 - a receive datapath corresponding to each data station coupled between said communications medium and said receive memory means for providing at least some data received over said communications medium to said receive memory means;
 - a transmit datapath corresponding to each data station coupled between said transmit memory means and said communications medium for providing at least some data from said transmit memory means to said communications medium;

RECEIVED

FEB 05 2002

Technology Center 2600

- 20 each said receive datapath including:
 a deserializer configured to receive serial data from said
 communications medium and output at least a portion
 of said received serial data in parallel;
 means for selectively transmitting, in response to one of
 25 said plurality of control signals, said data output by said
 deserializer to said receive memory means;
 each said transmit datapath including a serializer config-
 ured to receive parallel data and output serial data.
2. Apparatus, as claimed in claim 1, wherein each of said
 30 receive memory means and said transmit memory means is
 a buffer.
3. Apparatus, as claimed in claim 1, wherein said data
 received over said communications medium includes status
 data indicating at least a status of port activities.
- 35 4. Apparatus, as claimed in claim 1, wherein said data
 received over said communications medium comprises sta-
 tus data including at least a status of interrupts of at least one
 of said data stations and wherein each said receive datapath
 includes a demultiplexer coupled between said communica-
 40 tions path and said deserializer for diverting said status data
 to a first location prior to receipt of serial data in said
 deserializer.
5. Apparatus, as claimed in claim 4, wherein said first
 location comprises a first register.
- 45 6. Apparatus, as claimed in claim 5, wherein said appa-
 ratus is contained in a first network data station, coupled, via
 said communications medium, to a plurality of other data
 stations and wherein said first register stores status data from
 all said other data stations which are connected to said first
 50 network data station.
7. Apparatus, as claimed in claim 1, wherein said transmit
 datapath includes means for generating at least one prede-
 termined data pattern for transmission onto said communi-
 cations medium.
- 55 8. Apparatus, as claimed in claim 7, wherein said means
 for generating includes means for generating a plurality of
 predetermined data patterns and means for selecting among
 said plurality of data patterns in response to one of said
 plurality of control signals.
- 60 9. Apparatus, as claimed in claim 1, wherein said data
 stations include at least first and second network data
 stations, and said apparatus is contained in said first network
 data station, which is coupled, via said communications
 medium, to a first plurality of other data stations and also
 65 coupled, by said apparatus, via said communications
 medium, to said second network data station which is
 coupled to a second plurality of data stations and wherein:
